# OUTLOOK

---

Increasing liberalisation and globalisation of various economies around the world coupled with the communication revolution has added a new dimension to the competitiveness in business. The order of the day is mergers, acquisitions and alliances aimed at shedding costs, consolidating and synergising to produce globally competitive Companies.

In the sphere of Technical Services, India offers a great opportunity to global players to take advantage of these emerging scenarios. With a large pool of skilled and competent technical manpower combined with its economic edge, India makes an attractive choice for establishing partnerships. The objective is to provide quality Consultancy Services in Specialised areas to global players to achieve higher cost competitiveness on an international level.

**Core Engineering** was formed by the Principal Members having an extensive experience in the field of Project Management, Design, Construction and Installation of Marine Structures, Offshore Oil Platforms, Jetties, Submarine Pipelines, Loading / Unloading Terminals as well as onshore facilities. **Marine Practice of Core Engineering Group** deals exclusively with facilities located in high seas or on the coastline.

In line with the emerging perceptions and present business climate world wide, the Group considers its location at New Delhi in India to be an advantage. The Group also formed alliances with Associates who complement our strengths to develop a system fully capable of providing services for engineering of projects involving multi-disciplinary fronts.

The Group perceives that the vast experience and its capability combined with economic edge that India presents would make this arrangement a viable option which can be used by Global Players to suit their requirements on case to case basis. This is the approach that will provide most cost effective results without sacrificing quality in the years to come.

## OUR ENDEAVOUR

---

It is possible to carry out complete design and engineering including Front End Engineering through Core and its Associates in India.

However, the Group's emphasis at present is on taking up those parts of engineering that the Clients are comfortable to off load and which require limited interface. Alternatively the detailed engineering services are provided as a back office. This approach is intended as a confidence building measure, which will provide them opportunity to evaluate the effectiveness of the system being proposed.

The Group's strength emanates from long exposure of its founder members to Project Management Design and

engineering of large Projects. We are fully capable of providing assistance to Clients during conceptualisation and feasibility study of such Projects. Albeit we are able to offer assistance in many domains, yet we possess extensive relevant experience in the following specific areas:

- ◆ Offshore Oil / Gas Production and Processing Platforms.
- ◆ Feasibility and Engineering for Construction and Installation of facilities in High Seas.
- ◆ Jetties and Loading Unloading Terminals.
- ◆ Pipelines.

Extensive experience of dealing with a variety of situations has fortified the Group's unique problem-solving capability through a systematic analysis of any situation. We believe this is a forte, which comes handy in a general Consulting Environment.
